

MCMA 2017

Napoli, Italy
17th October 2017

Geant4-based Monte Carlo simulations of a transport beam line for multidisciplinary applications of laser-driven proton beams

Giuliana Milluzzo

*On behalf of the ELIMED collaboration
INFN - Laboratori Nazionali del Sud, Catania, Italy
Università degli Studi di Catania*

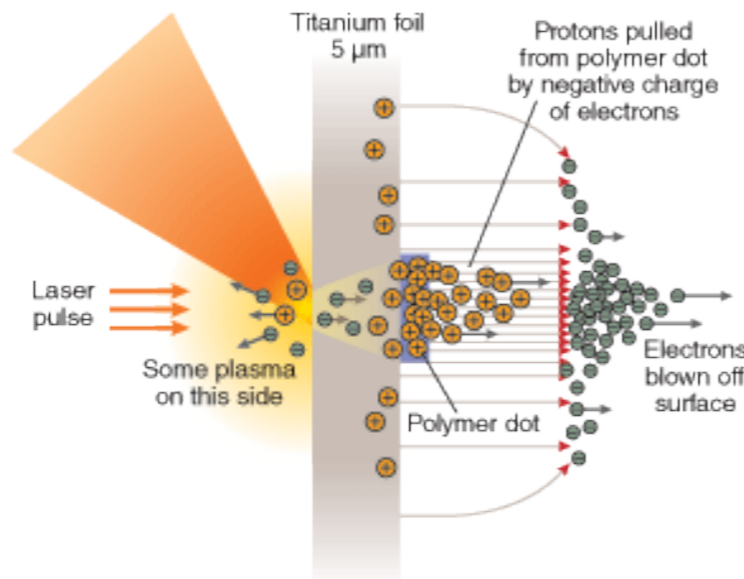

Conventional RF accelerators vs laser-driven for hadrontherapy

Courtesy of Siemens
And the University of Heidelberg, Germany

- An intense laser field ($> 10^{18} \text{ W/cm}^2$) blows off electrons from a target surface
- Fast electrons penetrate the foil and ionize atoms along their path \rightarrow a strong electric field is created ($\approx \text{TV/m}$)

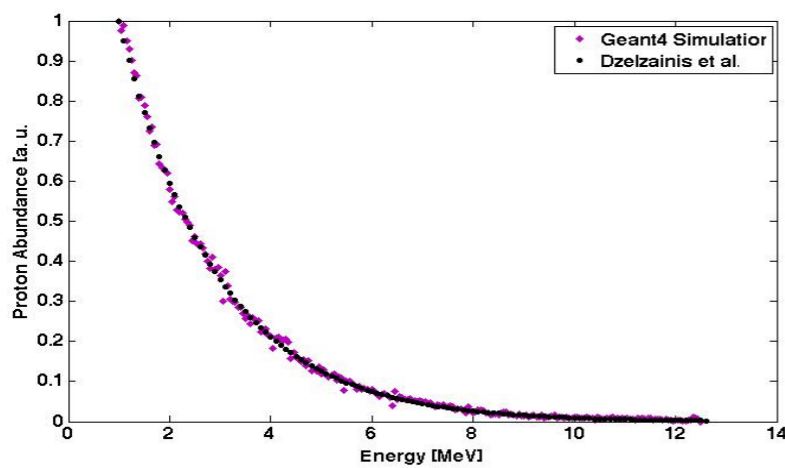

In a few microns multi-Mev protons and ions are accelerated

Laser-driven beams peculiarities

- **Wide angular distributions**

- **Large energy spread**

- **Extremely high dose rate per pulse**
 $10^7 - 10^9$ Gy/min (vs 10-50 Gy/min)

New paradigms for beam dosimetry

Requirements from ELI

- * Easily modify geometrical configurations
- * Accurate transport in magnetic fields
- * User friendly

Application structure

- * Component realistic model
- * Magnetic and electric field implementation
- * Realistic laser-driven particle source
- * Information scoring along the beamline

*The ELIMED application as a tool for beam optimization
and feasibility studies for multi-disciplinary applications*

ESS as an active modulator: results

ESS as an active modulator: results

3% of dose homogeneity in 2 cm of modulation region!

ESS as an active modulator: results

3% of dose homogeneity in 2 cm of modulation region!

- * Normalization to typical doses per session delivered in ocular melanoma proton treatments (15 Gy)
- * Re-calculation of the absolute weights (in Gy) of any single peak
- * Computation of number of shots per single peak to achieve the required dose

ESS as an active modulator: results

3% of dose homogeneity in 2 cm of modulation region!

- * Normalization to typical doses per session delivered in ocular melanoma proton treatments (15 Gy)
- * Re-calculation of the absolute weights (in Gy) of any single peak
- * Computation of number of shots per single peak to achieve the required dose

~ 1000 shots in total

- * Considering both laser repetition rate and ESS field frequency of 1 Hz ~ **16 minutes**
- * Considering laser repetition rate of 10 Hz and ESS field frequency of 1 Hz ~ **2 minutes**

Conclusions

- ELIMED application has been designed to be a Geant4 User-oriented application
- Geant4 fits well all the requirements from ELI management:
 - Simulate **complex geometrical elements** with the possibility to **switch on/off** components
modularity
 - Easy methods for **changing geometrical configurations** *interactive commands*
 - **Reliability** for particle transport in magnetic fields *robust tracking*
 - Accurate **energy/dose depositions** predictions and **secondary particles** production -> *well tested and validated* physics models
 - **User-friendly** and **easy-to-use** for non experienced Users -> *Qt interface with the possibility of changing all the key parameters/elements of the beamline*

Future developments

- Voxel phantom import (from DICOM)
- Calculation of LET distributions (and RBE?) in the perspective of future in-vitro/in-vivo experiments to be performed at ELI-Beamline
- Implementation of Geant4-DNA models? *spatio-temporal track correlations due to the extremely high dose rate per pulse*

Thank you
